Introduction

Agent Assist Workflows is a powerful feature in Telnyx Contact Center that guides agents through structured call interactions using AI-powered assistance. This system combines real-time speech-to-text transcription with intelligent workflow automation to help agents deliver consistent, high-quality customer service.

Key Benefits

- **Consistent Call Handling:** Ensure every agent follows the same structured process
 - **Real-time AI Assistance:** Get intelligent suggestions based on conversation context
 - **Automatic Data Capture:** Extract customer information from natural conversation
 - **Quality Assurance:** Track call completeness and agent compliance
 - **Reduced Training Time:** New agents can handle complex calls with guided assistance
-

Overview

The Agent Assist Workflows system consists of four main components:

1. **Workflow Definitions:** Structured templates that define the stages and items agents must complete
2. **Call Flow Integration:** Connect workflows to your inbound call routing via the Agent Assist node
3. **Agent Desktop Interface:** Three-panel view with checklist, transcription, and suggestions
4. **Supervisor Analytics:** Review completed workflows and transcription history

Architecture

Configuring Workflows

Creating a New Workflow

1. Navigate to **Admin** → **Workflows** in the sidebar
2. Click the **New Workflow** button
3. Fill in the workflow details:
 - **Name:** A descriptive name (e.g., "Healthcare Intake", "Sales Qualification")
 - **Description:** Explain the purpose of this workflow
 - **Category:** Group workflows by type (e.g., "Support", "Sales", "Operations")
 - **LLM Model:** Select the AI model for analysis and suggestions
 - **Active:** Enable to make the workflow available for use

Defining Stages

Stages represent the major phases of a call. Each stage contains items that agents must complete.

Example stages for a Healthcare Intake workflow:

1. Caller Identification
2. Intent Identification
3. Patient Information
4. Transport Details
5. Safety Questions
6. Confirmation

To add a stage:

1. Click **Add Stage** in the workflow editor
2. Enter the stage name and description
3. Set whether the stage is required
4. Drag stages to reorder as needed

Adding Items to Stages

Each stage contains items that represent specific tasks, questions, or data to collect.

To add an item:

1. Expand a stage in the workflow editor
2. Click **Add Item**
3. Configure the item properties:
 - **Label:** What the agent needs to do (e.g., "Greet caller with our brand name")
 - **Description:** Detailed instructions for the agent
 - **Type:** Action, Question, Topic, or Slot (Data)
 - **Completion Trigger:** Who completes this item (Agent or Customer)
 - **Required:** Whether this item must be completed

Item Configuration Panel

The right panel shows detailed configuration options:

- **Basic Info:** Type, Label, Description, Required toggle
- **Completion Trigger:** Agent, Customer, or Either
- **Prompt Hints:** Keywords to help AI detect completion (e.g., "my name is", "this is", "I'm", "speaking")
- **Slot Configuration** (for Data items):
 - **Slot Name:** Variable name for storing the value (e.g., `caller_name`)
 - **Data Type:** Text, Number, Date, Select, etc.
- **Validation Instructions:** LLM instructions for formatting (e.g., "Format as MM/DD/YYYY")

Item Types

Type	Purpose	Example
Action	Tasks the agent performs	"Greet caller with brand name"
Question	Questions to ask the customer	"Verify account number"
Topic	Discussion points to cover	"Explain service options"
Slot (Data)	Information to collect from customer	"Caller's full name", "Callback number"

Completion Triggers

The **Completion Trigger** setting determines when an item is marked as complete:

Trigger	Behavior
Agent	Completed when the agent performs the action (e.g., greeting)
Customer	Completed when the customer provides the information (e.g., name, account number)
Either	Completed when either party addresses the item

Important: For **Slot** items that collect customer data, set the trigger to **Customer**. This ensures the item is only marked complete when the customer actually provides the information, not just when the agent asks for it.

LLM Model Selection

Each workflow can use a different AI model for analysis and suggestion generation. Available models include:

- **OpenAI GPT-4o** (Recommended) - Best balance of speed and intelligence
- **OpenAI GPT-4o-mini** - Faster, more economical
- **Anthropic Claude** models - Alternative providers
- **Google Gemini** models - High context length
- **Open source models** - Llama, Mistral, etc.

Select the model in the workflow edit dialog. Premium models (OpenAI, Anthropic, Google) generally provide better suggestions.

Integrating with Call Flows

Agent Assist Node

To enable Agent Assist Workflows for incoming calls, add the **Agent Assist** node to your Call Flow.

1. Open the **Call Flow Editor** (Admin → Call Flows)
2. Add an **Agent Assist** node to your flow (typically after Answer Call and before Enqueue Call)
3. Configure the node settings in the right panel:
 - **Enable Agent Assist:** Toggle on to activate
 - **Assist Type:** Select "Workflows" (instead of "KB Articles")
 - **Workflow:** Choose the workflow from the dropdown (e.g., "Healthcare Intake")

Workflow Mode Configuration

The configuration panel shows:

- **Workflow Selection:** Dropdown with all available workflows
- **Workflow Details:** Shows stages count and items count (e.g., "5 stages, 21 items")
- **Auto-start on Answer:** Automatically begin workflow tracking when call connects
- **Show AI Suggestions:** Display AI-powered suggestions to agents during the call
- **Auto-detect Item Completion:** Automatically mark workflow items as complete based on conversation analysis

```
Agent Assist Node Configuration
├─ Enable Agent Assist: ON
├─ Assist Type: Workflows
├─ Workflow: Healthcare Intake (Operations)
└─   └─ 5 stages • 21 items
```

- └ Auto-start on Answer: ON
- └ Show AI Suggestions: ON
- └ Auto-detect Item Completion: ON

Agent Desktop Experience

When an agent receives a call with an active workflow, the Agent Desktop displays a three-panel workflow interface:

Workflow Checklist Panel (Left)

The checklist panel shows all stages and items in the workflow:

- **Green checkmarks** ✓ indicate completed items
- **Orange indicators** show items in progress
- **Gray items** are pending
- **AI badge** appears when items are auto-completed by AI analysis
- **Confidence percentage** shows how certain the AI is about auto-completions

Manual completion: Click on any item to manually mark it complete or enter values for data slots.

Live Transcription Panel (Center)

Real-time conversation transcript with:

- **Customer messages** (left-aligned, dark background)
- **Agent messages** (right-aligned, purple background)
- **Intent badges** showing detected customer intents
- **Sentiment indicators** (positive/neutral/negative)
- **Confidence scores** for AI detections

The transcription is analyzed in real-time to automatically:

- Detect when items are completed
- Extract data for slot items
- Identify customer intent and sentiment

Suggested Responses Panel (Right)

AI-generated scripts the agent can use:

- Suggestions appear as the workflow progresses
- **Click to copy** any suggestion to clipboard
- Suggestions are contextual, based on:
 - Current workflow item
 - Conversation history
 - Agent name (auto-inserted)
 - Brand/company name

Example suggestions:

- "Thank you for calling Global Medical Response. This is Leszek, how may I assist you today?"
- "May I have your full name, please, so I can better assist you?"
- "Could you please provide your callback number?"

Progress Tracking

The bottom progress bar shows:

- **Stage indicators** (1-6) showing completion status
 - **Green progress bar** for overall completion percentage
 - **Item counts** (e.g., "9/24 items completed")
 - **Percentage badge** (e.g., "38%")
-

Supervisor Call History

Transcript Tab

Supervisors can review completed workflows in the Call History section:

1. Navigate to **Supervisor** → **Call History**
2. Select a completed interaction
3. Click the **Transcript** tab

The Transcript tab displays the same three-panel view as the agent desktop, but in read-only mode for review purposes.

Interaction Details Header

At the top, you can see:

- **Participants:** Caller number, caller name, agent, queue
- **Call Details:** Direction, status, start time, duration, wrapup codes
- **Call IDs:** Interaction ID, Call Control ID, Call Session ID (for debugging)

Reviewing Completed Workflows

In the history view, supervisors can:

- **Review all stages and items** with completion status
- **See extracted data values** (e.g., customer names, account numbers)

- **Read the full conversation transcript**
 - **View all AI-generated suggestions** that were offered
 - **Verify compliance** with workflow requirements
 - **Identify training opportunities** from incomplete items
-

Best Practices

Workflow Design

1. **Keep stages focused:** Each stage should have a clear purpose
2. **Order items logically:** Follow the natural conversation flow
3. **Write clear descriptions:** Help agents understand what's expected
4. **Use appropriate item types:** Choose the right type for each task
5. **Set correct completion triggers:** Use "Customer" for data collection items

Writing Good Item Labels

Good examples:

- "Greet caller with brand name and your name"
- "Verify caller's identity using account number"
- "Collect patient's full name"

Avoid:

- "Greeting" (too vague)
- "Ask for name" (unclear whose name)

LLM Prompt Hints

For each item, you can add prompt hints to help the AI better detect completion:

- **Keywords:** Words that indicate the item is addressed
 - **Phrases:** Common ways the item might be completed
 - **Patterns:** Data formats to look for (e.g., phone numbers, dates)
-

Troubleshooting

Common Issues

Issue	Solution
Items not auto-completing	Check completion trigger setting. For data collection, use "Customer" trigger
Wrong data extracted	Add more specific prompt hints to the item
Suggestions showing [Your Name]	Ensure agent has first/last name in their user profile
No transcription showing	Verify transcription is enabled in Agent Assist node
Workflow not appearing	Check that workflow is set to "Active"

Logs and Debugging

Check browser console for detailed logs:

- `[AgentAssistWorkflow]` - Workflow state changes
- `[generateSuggestion]` - Suggestion generation
- `[analyzeTranscript]` - Transcript analysis
